

Formal Review Request Template

Requester: _Hiram Zaldana_____

Date: _10/07/2026_____

Reviewer: _Jack_DiMento_____

Approx. review duration: _____

Choose **one primary review method**:

Code / Software Review

Code Quality Review

Inspect the code for issues such as readability, modularity, maintainability, efficiency, and appropriate programming practices.

White-Box / Edge-Case Testing

Inspect the internal logic and systematically test branches, boundary conditions, exceptions, or adversarial inputs.

Black-Box / Functional Testing

Develop test cases from the expected requirements or behavior and determine whether the software produces the expected results.

Performance / Runtime Testing

Systematically evaluate whether the software meets relevant runtime or performance expectations.

Usability Review

- **Task-Based Usability Testing**

Give the reviewer/user specific tasks to complete while you observe what they do, where they succeed, and where they encounter problems. A think-aloud protocol may be used.

- **Heuristic / Guidelines Evaluation**

Systematically inspect the interface using identified usability principles, heuristics, or design guidelines.

- **Prototype Usability Testing**

Have users complete defined tasks using a wireframe, prototype, or partially implemented interface.

Design Review

- **Architecture / Conceptual Design Review**

Evaluate whether architecture and major design decisions align with project requirements and constraints.

- **Preliminary Design / UML Review**

Evaluate proposed system structure, diagrams, component relationships, interfaces, or other design artifacts.

- **Security Design Review**

Evaluate relevant authentication flows, trust boundaries, data protection, error handling, or other security-related design decisions.

Other

- **Other review method:**

Explain what the reviewer will evaluate and why this method is appropriate for your work:

The reviewer will test several core instructor/admin workflows in TAG'em Up to determine whether they function as expected from a user's perspective. Functional testing is appropriate because the goal is to verify that these existing workflows can be completed successfully

without requiring the reviewer to inspect the underlying code.

Review Request Details

1) What specifically should the reviewer examine or interact with?

Log in using an admin/instructor account and test the following core workflows:

- Create or select a semester.
 - Create teams within a semester.
 - Import sample student data using the provided CSV format (can be found in lib/assets).
 - View the teams and students associated with the semester.
 - Navigate to the Team Status page and verify that the available initial team/status information is displayed.
-

2) What question do you want this review to help answer?

Examples:

- Does this implementation correctly handle boundary and error cases?
- Can a new user complete the checkout task without assistance?
- Does this architecture satisfy our project's stated requirements?

Can another user successfully complete the basic instructor/admin workflows in TAG'em Up without encountering errors, confusing behavior, or missing information?

3) What should the reviewer focus on?

Focus on whether the core workflows function as expected, particularly logging in (view db/[seeds.rb](#) for admin accounts), semester/team setup, CSV import, navigation between relevant pages, and viewing the initial Team Status information.

4) What should the reviewer *not* evaluate during this review?

Examples:

- Do not evaluate visual polish or mobile responsiveness (for a usability test evaluating navigation and task completion)
- Do not evaluate the database layer or unfinished API integration (for a code review focusing on the authentication module)

Do not evaluate visual styling or mobile responsiveness. Also, do not evaluate functionality for other user roles, such as students or TAs, because those workflows are still being developed.

5) What should the reviewer use to judge the work?

Examples include expected software behavior, project requirements, coding best practices, usability heuristics, or design constraints.

Judge the application based on whether each requested workflow can be completed successfully, whether the resulting data is displayed correctly, and whether any errors or unexpected behavior prevent completion of the task.

Reviewer Section

1) Briefly describe what you actually did during the review.

Examples include executing defined test cases, inspecting particular code paths, observing a user completing defined tasks, or systematically examining a design against specified criteria.

I got the project up and running locally on my device. I then logged in with an admin account, navigated around, created a new semester, imported students, and made teams.

2) What portions of the artifact did you evaluate?

I evaluated the running website going through all of the main flows provided. These flows included Log in, semester creation, student import, team creation etc.

3) Provide or link to relevant evidence such as test cases, screenshots, notes, annotated code, **teams**

Review team membership and create new teams. Team was successfully created.

[New Team](#)

Import Team Roster CSV

Upload a roster CSV to create/update students and teams for the selected semester.

[Choose File](#) No file chosen

observations, or other review artifacts.

Findings

Strengths:

- UI/UX is really strong/consistent
- Very easy to navigate and find your way around the site.

Issues / Defects:

Description of Issue	Severity (Low/Med/High)	Evidence / Example	Suggestions
Issue with adding students to a team	Med	After importing students, when trying to make	Make sure students are synced with a

		teams, sometimes the student list would show up sometimes it wouldn't I don't know if this is a user error but I would look into it.	semester after being imported.

Requester Follow-Up

1) How will you address the feedback? If you decide **not** to, briefly explain why.
