

Formal Review Request Template

Requester: Sri Aashrith Vithana

Date: 6 October, 2026

Reviewer: Javier Nieves

Approx. review duration: 1 hour

Choose one primary review method:

Code / Software Review

Code Quality Review

Inspect the code for issues such as readability, modularity, maintainability, efficiency, and appropriate programming practices.

White-Box / Edge-Case Testing

Inspect the internal logic and systematically test branches, boundary conditions, exceptions, or adversarial inputs.

Black-Box / Functional Testing

Develop test cases from the expected requirements or behavior and determine whether the software produces the expected results.

Performance / Runtime Testing

Systematically evaluate whether the software meets relevant runtime or performance expectations.

Usability Review

- **Task-Based Usability Testing**

Give the reviewer/user specific tasks to complete while you observe what they do, where they succeed, and where they encounter problems. A think-aloud protocol may be used.

- **Heuristic / Guidelines Evaluation**

Systematically inspect the interface using identified usability principles, heuristics, or design guidelines.

- **Prototype Usability Testing**

Have users complete defined tasks using a wireframe, prototype, or partially implemented interface.

Design Review

- **Architecture / Conceptual Design Review**

Evaluate whether architecture and major design decisions align with project requirements and constraints.

- **Preliminary Design / UML Review**

Evaluate proposed system structure, diagrams, component relationships, interfaces, or other design artifacts.

- **Security Design Review**

Evaluate relevant authentication flows, trust boundaries, data protection, error handling, or other security-related design decisions.

Other

- **Other review method:**

Explain what the reviewer will evaluate and why this method is appropriate for your work:

I choose to pick the design Review for my project since the current project has a lot of complex components and I want a review or a suggestion for improvement on the project design

Review Request Details

1) What specifically should the reviewer examine or interact with?

Right now, we have a lot of data with specific formulas to generate a panel for the finance data. I would want the reviewer to review whether the interface of the application is useable and if there any changes required.

2) What question do you want this review to help answer?

Examples:

- Does this implementation correctly handle boundary and error cases?
- Can a new user complete the checkout task without assistance?
- Does this architecture satisfy our project's stated requirements?

Does the user interface satisfy the project's requirements.

What components can be added or removed for the users to understand data projected easily/clearly.

3) What should the reviewer focus on?

The reviewer should focus on whether the UI is clear. Also as a user is it easy to understand about all the data project in the panel.

4) What should the reviewer *not* evaluate during this review?

Examples:

- Do not evaluate visual polish or mobile responsiveness (for a usability test evaluating navigation and task completion)
- Do not evaluate the database layer or unfinished API integration (for a code review focusing on the authentication module)

Currently there are still components that are needed to be added (such as the components of my teammates) So I expect the reviewer to not evaluate that during this review.

5) What should the reviewer use to judge the work?

I expect the reviewer to use basic usability heuristics .

Examples include expected software behavior, project requirements, coding best practices, usability heuristics, or design constraints.

Reviewer Section

1) Briefly describe what you actually did during the review.

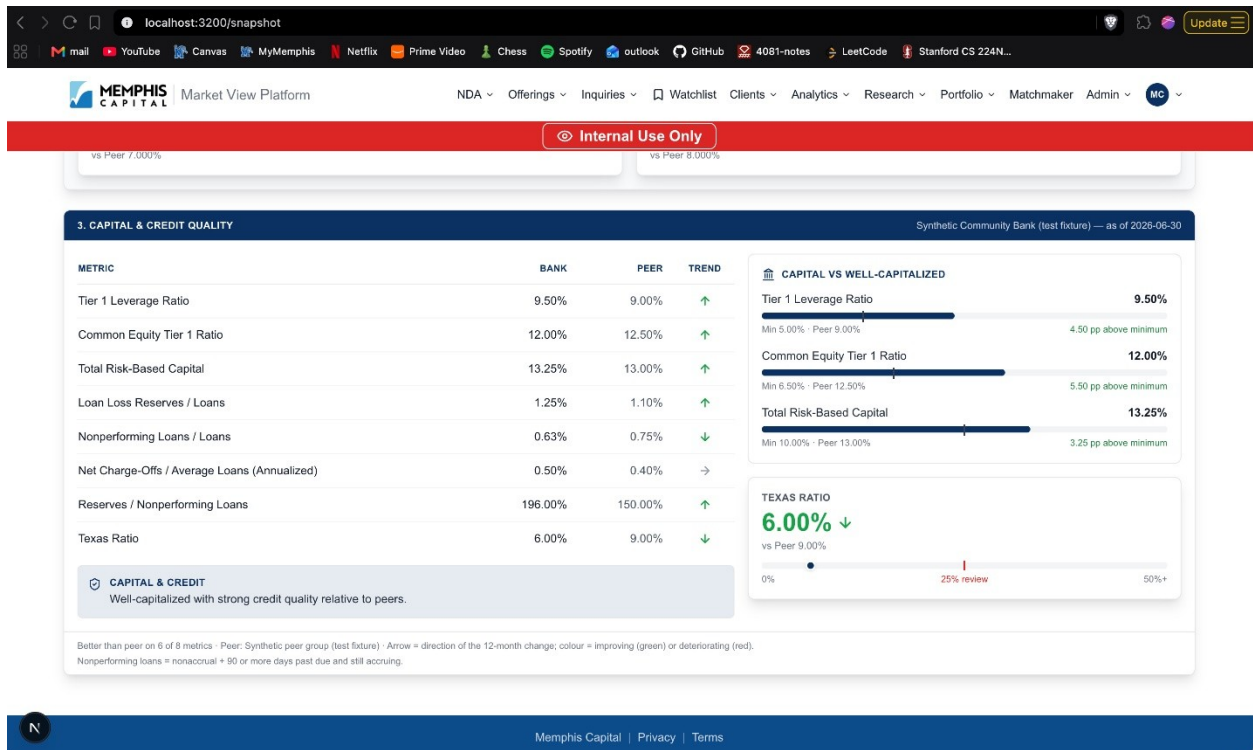

Examples include executing defined test cases, inspecting particular code paths, observing a user completing defined tasks, or systematically examining a design against specified criteria.

The UI is easy to follow, so I went ahead and clicked on everything to see if it would lead to any new pages, no buttons currently work, but the data structured in Capital & credit quality looks easy to follow.

2) What portions of the artifact did you evaluate?

The one page that they had working and the information in the Capital & credit quality portion.

3) Provide or link to relevant evidence such as test cases, screenshots, notes, annotated code, observations, or other review artifacts.

Findings

Strengths:

- UI is clear
- Information is clearly displayed

Issues / Defects:

Description of Issue	Severity (Low/Med/High)	Evidence / Example	Suggestions
No buttons work	MED	Clicked on all of them; no other pages loaded	Still early in development, they will be added soon, but needs to be taken care off, get the login to work first of all
A page explaining what each part of the capital & credit quality mean	LOW	Some might not understand what the arrows mean for example	Create a page that explains Bank, peer, and trend

Requester Follow-Up

1) How will you address the feedback? If you decide **not** to, briefly explain why.

No buttons work (Med): The navigation buttons at the top (NDA, Offerings, Clients, etc.) are a copy of Memphis Capital's Market View Platform layout, so our page looks like the real platform. Those pages belong to the platform itself and are not part of our project, so we will not build them. To avoid confusion, I will suggest to my team that we add a short note on the page saying the menu is display-only. Sign-in and the institution search are already being worked on by our team lead in an open pull request, so the login will work once that is merged.

Explaining Bank, Peer and Trend (Low): I agree with this. Instead of a separate page, I will add the explanations directly in the Capital & Credit Quality panel so users do not have to leave

the page: hover tooltips on the Bank, Peer and Trend column headers and on each metric name, saying what the metric means and whether higher or lower is better. I will also make the existing legend at the bottom of the panel (arrow = direction of the 12-month change, green = improving, red = getting worse, grey = stable) easier to see. I will create a GitHub issue for this so it is planned into a sprint.
