

Formal Review Request Template

Requester: Nishanth Manoj

Reviewer: Devin Veasley

Date:

_____ 10/07/26 _____

Approx. review duration: 1 hour

Choose **one primary review method**:

Code / Software Review X

Code Quality Review

Inspect the code for issues such as readability, modularity, maintainability, efficiency, and appropriate programming practices.

White-Box / Edge-Case Testing

Inspect the internal logic and systematically test branches, boundary conditions, exceptions, or adversarial inputs.

Black-Box / Functional Testing

Develop test cases from the expected requirements or behavior and determine whether the software produces the expected results.

Performance / Runtime Testing

Systematically evaluate whether the software meets relevant runtime or performance expectations.

Usability Review

- **Task-Based Usability Testing**
Give the reviewer/user specific tasks to complete while you observe what they do, where they succeed, and where they encounter problems. A think-aloud protocol may be used.

- **Heuristic / Guidelines Evaluation**
Systematically inspect the interface using identified usability principles, heuristics, or design guidelines.
- **Prototype Usability Testing**
Have users complete defined tasks using a wireframe, prototype, or partially implemented interface.

Design Review

- **Architecture / Conceptual Design Review**
Evaluate whether architecture and major design decisions align with project requirements and constraints.
- **Preliminary Design / UML Review**
Evaluate proposed system structure, diagrams, component relationships, interfaces, or other design artifacts.
- **Security Design Review**
Evaluate relevant authentication flows, trust boundaries, data protection, error handling, or other security-related design decisions.

Other

- **Other review method:**

Explain what the reviewer will evaluate and why this method is appropriate for your work:

- The reviewer will evaluate parts of our TAG'em Up project code, mainly the Demo Day status page and the CSV import code for student and team information. A white-box

code review is appropriate because we want to check the code quality and find possible issues before making more changes.

Review Request Details

- 1) What specifically should the reviewer examine or interact with?

The `_demo_day_status.html.erb` file and the CSV import code in `app/models/semester.rb`, mainly lines 550–620. Check how the code is organized and how it handles student and team data.

- 2) What question do you want this review to help answer?

Examples:

- Does this implementation correctly handle boundary and error cases?
- Can a new user complete the checkout task without assistance?
- Does this architecture satisfy our project's stated requirements?

The main question would be if the code is organized properly and does it handle missing or incorrect CSV data without causing errors?

- 3) What should the reviewer focus on?

They should focus on code readability, organization, validation, and possible errors. Also check if the CSV import handles missing information correctly and gives useful error messages.

- 4) What should the reviewer *not* evaluate during this review?

The reviewer does not need to evaluate the website design, styling, or other parts of the project that are not related to the selected code.

Examples:

- Do not evaluate visual polish or mobile responsiveness (for a usability test evaluating navigation and task completion)
- Do not evaluate the database layer or unfinished API integration (for a code review focusing on the authentication module)

5) What should the reviewer use to judge the work?

Examples include expected software behavior, project requirements, coding best practices, usability heuristics, or design constraints.

I think primarily they should use coding best practices to see if the readability error handling and the expected behavior of the project aligns. Also check if the code follows the existing structure of the application.

Reviewer Section

1) Briefly describe what you actually did during the review

As requested by Nishanth, I conducted a static White-Box review of the provided project artifacts. I reviewed the `_demo_day_status.html.erb` page containing the logic of sprint progress information and `app/models/smester.rb` lines 550 through 620. I reviewed the code for readability, organization, consistency with the apparent intended behavior, and potential validation or edge-case issues.

2) What portions of the artifact did you evaluate?

I evaluated:

- The HTML/ERB page displays the group's project progress and related information.
 - The CSV import implementation, specifically the validation-related code around lines 550–620
-

3) Provide or link to relevant evidence such as test cases, screenshots, notes, annotated code, observations, or other review artifacts.

```

# Skip empty rows
next if name.blank? && email.blank?

# Required field validation
if name.blank?
  row_errors << "Row #{i + 2}: Missing Full Name"
  skipped_count += 1
  next
end

if email.blank? || !(email =~ URI::MailTo::EMAIL_REGEXP)
  row_errors << "Row #{i + 2}: Missing or invalid Email (#{email})"
  skipped_count += 1
  next
end

# URL validation
url_fields = {
  "Repo URL" => repo_url,
  "Project Board URL" => project_board,
  "Timesheet URL" => timesheet,
  "Client Notes URL" => client_notes
}
url_fields.each do |label, url|
  if url.present? && !(url =~ /\Ahttps?:\/\/[\S]+\z/)
    row_errors << "Row #{i + 2}: #{label} is invalid: #{url}"
    skipped_count += 1
  end
end

```

Findings

Strengths:

- When processing CSV files, they've made sure to include logic that skips over missing data.
- Includes URL and Email validating logic. Given URLs are compared to a regex pattern to verify a valid email address
- Logic gives error message for incorrect or missing data as well as which row in the CSV where the error occurred.

Issues / Defects:

Description of Issue	Severity (Low/Med/High)	Evidence / Example	Suggestions

Requester Follow-Up

1) How will you address the feedback? If you decide **not** to, briefly explain why.

I will go through the feedback and see if there are any changes that need to be made. Devin mentioned that the CSV import handles missing data and gives error messages, which is good. No major issues found so far. Will keep those parts the same and check for any other problems as we continue working on the project. Also need to make sure the code works correctly when importing the current semester data. Will test it more once we have all the student and team information added.
